

# asOne AG

The asOne AG has extended its product range of security software and is looking for resellers to take the new products to market.

**D**enis Dunham, Sales Manager UK said: "We are the specialists for the safe storage of digital information. With our experience from the area of long-term archiving we have extensive know-how in the field of data security that we market through qualified resellers. We offer sophisticated safety technologies for any application and any enterprise in any field of business.

The asOne ContentStore demonstrates efficiency: Make digital information available easy and fast 3:53 pm. The meeting starts soon. Where are the documents for the Miller customer project? Too late! 3:54 pm. Just a click on the cabinet symbol, enter key words and here they are. All the documents from wherever are there - on time

"The asOne Document Server is among these safety technologies. System integrators plug it into any kind of application to make data from these applications meet the requirements of legal admissibility.

"Because of its check sums for each digital object it even fulfils the high request to manipulation security for temporary stored objects on changeable media before the migration on optical media. Revision-safe storage is in particular relevant for the new EU tax legislation after which fiscally

relevant digital information has to be made available for tax inspections. This is vital for every company. Beyond that the asOne document Server reduces the workload of databases and file systems. The customer list reads like a who's who of global players such as ABB, Union Investment and KPMG.

With the asOne ContentStore the asOne AG recently introduced a solution for safe storing and fast retrieval of files. The product particularly attracts medium-size companies. It is considered as an efficient aid and corresponds thereby to the requirement of a broad user layer.

The asOne SecurityStore for Exchange offers maximum security with high additional use. With this software solution the asOne AG addresses enterprises whose e-mail traffic is based on the widespread Microsoft Exchange server. The problem of the Exchange users has two sides, the security on the one and the performance on the other side.

With the asOne SecurityStore for Exchange an Exchange server is capable of handling far more email volume. This leads to a direct increase in performance. The back up and restoration times are shorter, the provisional PST archives as well as post box limitations are omitted and the workload for administration is also reduced.
